# INTRODUCTION

- The **Library Management System** is a desktop-based application developed using **Java and JavaFX** to automate and simplify library operations.
- It helps in efficiently managing books, issuing and returning records, and maintaining student transactions with minimal manual effort.
- The system integrates with **MongoDB** to store and retrieve book details, issue records, and return information dynamically.
- A clean and interactive **JavaFX user interface** allows users to add, issue, and return books easily, along with viewing available and issued book lists.
- The system also includes an automatic **fine calculation feature** that computes penalties for late returns, ensuring accuracy and transparency in library management.

# TECHNICAL APPROACH

## ➤ *Technology Used:*

This project is developed using **Java** and **JavaFX** for the front-end user interface, and **MongoDB** as the back-end database to store book and user records efficiently.

## ➤ *Database Integration:*

All records (books, issued details, return logs) are stored and managed in **MongoDB**, ensuring persistent and dynamic data handling.

## ➤ *User Interface:*

A simple and clean **JavaFX GUI** has been used with intuitive buttons, labels, and text fields. Each operation (Add, Issue, Return, View) is handled through a dedicated page.

## ➤ *Fine Calculation:*

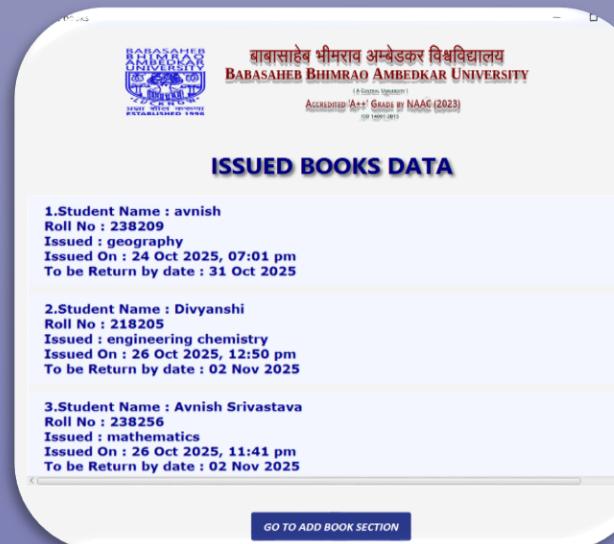

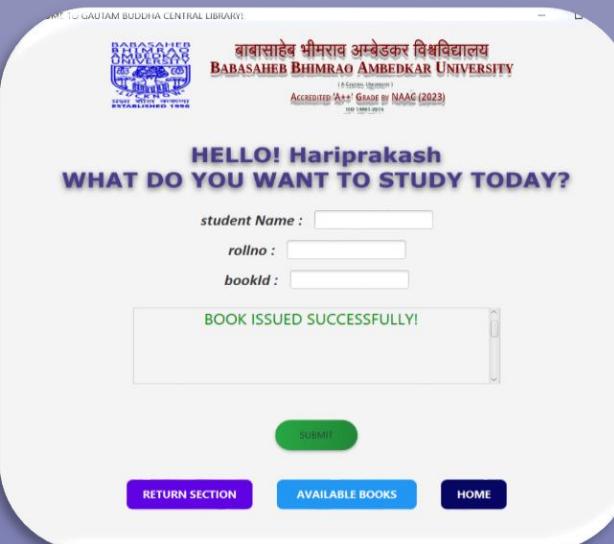

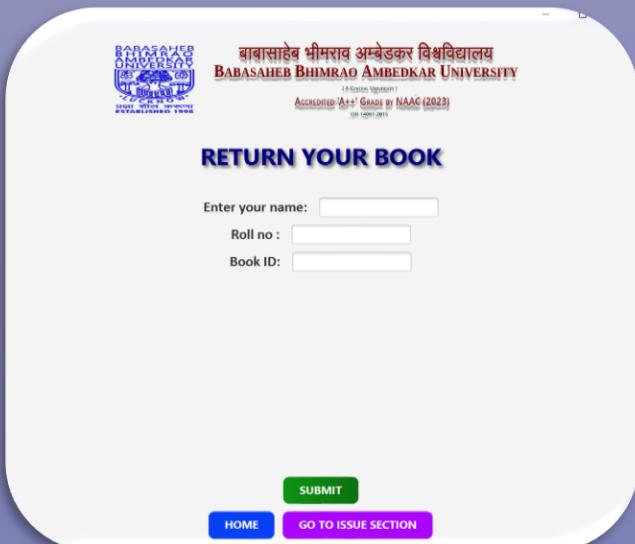

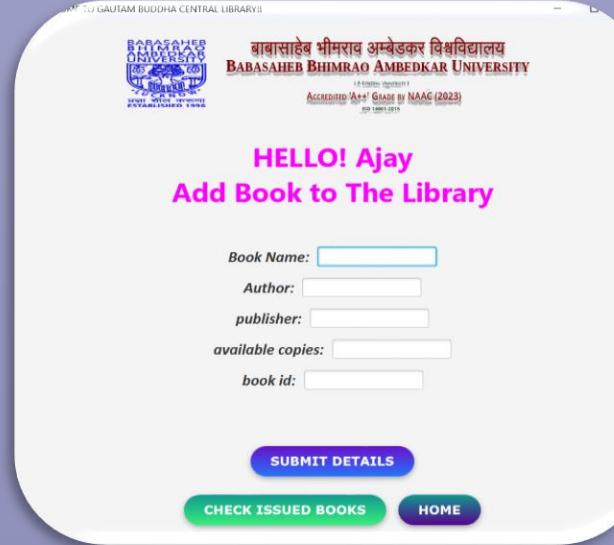

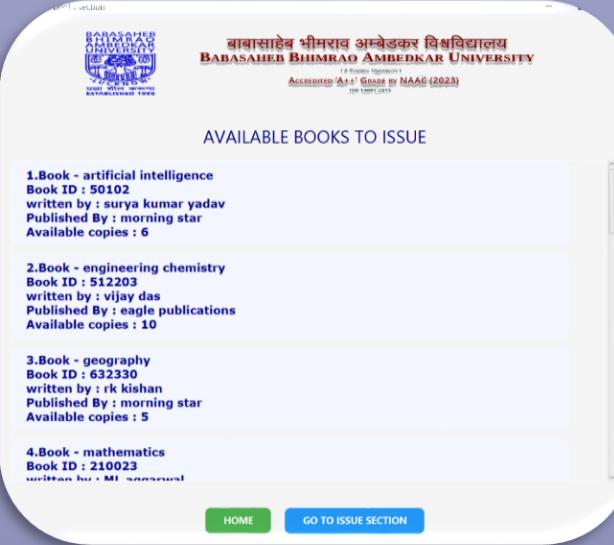

The system automatically computes a fine based on the number of late days, ensuring accuracy and transparency in the return process.

# KEY FUNCTIONALITIES

- **Add Book:** Allows the librarian to add new books with details such as title, author, publisher, and available copies.
- **Issue Book:** Enables issuing of books to students by verifying book availability and updating stock automatically.
- **Return Book:** Facilitates the return process and automatically calculates fines for late submissions and displays them on screen.
- **Available Books Section:** Displays all books currently available in the library fetched directly from the database.
- **Issued Books Section:** Shows the list of all issued books along with student details and due dates with a proper format.

# PAGES

# TECHNOLOGY USED

- *BACKEND : Java*
- *DATABASE : MONGODB*
- *GUI : JavaFX*
